

inputtrc.sty

Tracing Which File Loads Which*

Uwe Lück[†]

October 10, 2012

Abstract

`inputtrc.sty` produces screen/log messages ‘ $\langle current \rangle \llcorner \text{INPUTTING} \llcorner \langle next \rangle$ ’ on L^AT_EX input commands, $\langle current \rangle$ and $\langle next \rangle$ being file names. The message indents reflect the input nesting level. This can be turned on and off, and the “indent unit” can be chosen. ‘ $\text{RETURNING} \llcorner \text{TO} \llcorner \langle current \rangle$ ’ may be added. These messages should help especially when you otherwise get a screen message about ‘1. $\langle digits \rangle$ ’ referring to an input line while you have no idea in which *file* that line is.—The implementation somewhat resembles packages `filehook`, `currfile`, `FiNK` and `inputfile`.

*This document describes version [v0.3](#) of `inputtrc.sty` as of 2012/10/10.

[†]<http://contact-ednotes.sty.de.vu>

1 Features and Usage

1.1 Installing, Calling, and Package Options

The file `inputrc.sty` is provided ready, installation only requires putting it somewhere where `TeX` finds it (which may need updating the filename data base).¹

After ‘`\documentclass`’, you may load `inputrc` (as usually) by

```
\usepackage{inputrc}
```

In order to use one of the package options that come with v0.3, you may type

```
\usepackage[⟨ir⟩]{inputrc}
```

where `⟨ir⟩` is ‘`i`’, ‘`r`’, or ‘`ir`’ (—or ‘`i,r`’). However, you may want to see what ‘`\documentclass`’ loads; then precede ‘`\documentclass`’ with

```
\RequirePackage[⟨ir⟩]{inputrc}
```

`[i]` issues ‘`\dotracinginputs`’ immediately, `[r]` issues ‘`\dotracingreturns`’ immediately, and `[ir]` issues ‘`\dotracinginputsreturns`’ immediately. So ‘`[ir]`’ is like ‘`[i,r]`’.

1.2 Input

Indeed, the ‘INPUTTING’ messages appear after command `\dotracinginputs` only, *unless* you load the package with option `[i]` or `[ir]`. The command `\notracinginputs` turns the feature off again.

`\setinputindentunit{⟨cmds⟩}` globally sets the “indent unit,” whose default is set by

```
\setinputindentunit{\space\space}
```

in `inputrc.sty`. By default, the indent for what the main file (to whose name ‘`\jobname`’ expands—`TODO`: extension is not yet dealt with) loads is two spaces; each nesting level increases the indent by two more spaces, and the indent is reduced again when a loaded file is left. (`TODO`: not dealt with ‘`\dotracinginputs`’ in other files yet, may need `fink`.) The first indent and the indent difference will be, e.g., *three* spaces if you insert

```
\setinputindentunit{\space\space\space}
```

Note that only *L^AT_EX* input commands are recognized by `inputrc.sty` (at present, `TODO`). This means that ‘`\input`’ without braces is not recognized: it neither produces a message nor changes the indent, and with

```
\input⟨file⟩
```

where `⟨file⟩` loads other files, files that `⟨file⟩` loads directly produce *wrong* messages.

¹<http://www.tex.ac.uk/cgi-bin/texfaq2html?label=inst-wlcf>

1.3 After Input

`\dotracingreturns` adds a message

`RETURNING_TO_<current> after <current>INPUTTING_<next>`

meaning that processing file `<next>` has been finished. The package issues this command immediately if called with option `[r]`. Use `\notracingreturns` to turn this additional feature off again.

`\dotracinginputsreturns` calls both

`\dotracinginputs` and `\dotracingreturns`

at (about) the same time. On package option `[ir]`, this command is issued immediately. `\notracinginputsreturns` switches off both kinds of messages.

2 What it is Good for

TEX's primitive '`\input`' (that LATEX represents as `\@@input`) sends a left round bracket to screen, followed by the path of the loaded file. When TEX stops reading the file, a right round bracket is sent to screen. This screen log suffices to trace which files load which other files (directly). However, this has a quite little visual effect and hardly reflects input nesting in an intuitive way. And when an inputted file produces many messages, it becomes quite impossible to trace input nesting by eyes and mind only.

This may be very painful in debugging. Sometimes you get a warning or error message and you are unable to tell which file produced the message (if the file is not a LATEX package issuing the proper *package* warnings and errors)²—typically the *number of the line* that caused the warning is shown, but not the *file name*.

Indeed on the `texhax` mailing list, *Karl Berry* posted the following:³

Sometimes it would be helpful for tex debugging to get a “backtrace” of the files that tex is executing. It could be something static, that reads a .log file (or maybe .fls file from -recorder) and reports on which files were opened and closed in some way that is readable for deep nesting.

I seem to recall that auctex and presumably front ends have dealt with extracting the filenames, at least, out of the mess of garbage printed to the terminal on a typical run, parsing all the open/close parens, but I've been unable to find anything that works as a separate utility.

Does anyone know of something to do this?

Failing anything else, I wonder about adding a new primitive to pdftex to dump the input stack at any point. Then we could get line numbers too, I expect.

²\PackageWarning etc.

³<http://tug.org/pipermail/texhax/2010-February/014305.html>

The subject line was “*tex filename backtrace utility*”.—Ronald Fehd joined.⁴

I am glad to see this suggestion as I have occasional problems identifying from which of my included files the error message is coming from.

and suggested using the programming language SAS.

Karl’s suggestion to filter the .log file would have the advantage over the present approach that information not relevant for input tracing would be stripped off. However, more in the direction addressed by Ronald Fehd, any message from a file may be wanted to be attributed to that file. The present approach should be helpful then, you just must read the log back to the last line containing ‘INPUTTING’—or to RETURNING TO (v0.2).

The present approach was inspired by Karl’s idea to provide a new TEX primitive. This first triggered my reply⁵ claiming one could just redefine the primitive ‘\input’ as a macro—a little too optimistic. In the documentation for his FINK package,⁶ Didier Verna remarks that this primitive parses the file name in a way that is somewhat difficult to imitate by macros:

(one would have to parse the characters one by one, and I’m not ready to do so...)

Instead, I here change two LATEX macros that use the primitive.

3 Example

It is especially nice to watch hyperref loading quite a bunch from Heiko’s oberdiek bundle (on running the present inputtrc.tex):⁷

```

4.2 Core Definitions

Initializations of indent, current filename, and filename stack:

```
19  \gdef\IT@indent{\IT@indent@unit}
20  \xdef\IT@currfile{\jobname\space}

... TODO: add .tex unless ...

21  \xdef\IT@filestack{\relax}

... \relax saves braces around job file name when the file stack is unbuilt.
    \IT@prim@input{<file>} will replace LATEX's \@@input (at certain places,
see below).

22  \newcommand*\IT@prim@input[1]{%
23      \typeout{\IT@indent\IT@currfile INPUTTING #1}%

... TODO: option to write to .log only.

24  \xdef\IT@filestack{\IT@currfile\IT@filestack}%
25  \xdef\IT@currfile{#1}%
26  \expandafter \gdef\expandafter \IT@indent\expandafter{%
```

```

27      \IT@indent \IT@indent@unit}
28      \@@input#1
29      \expandafter\IT@pop@indent\IT@indent  \@nil
30      \expandafter\IT@pop@file  \IT@filestack\@nil
31      \IT@maybe@returnmessage          %% v0.2
32  }
33 \def\IT@pop@indent#1#2\@nil{\gdef\IT@indent{#2}}
34 \def\IT@pop@file #1#2\@nil{%
35   \gdef\IT@currfile{#1}\gdef\IT@filestack{#2}}
... cf. LaTeX's \pushfilename/\popfilename.

36 \newcommand*\IT@the@returnmessage}{%
37   \typeout{\IT@indent RETURNING TO \IT@currfile}}
... the “active” version of \IT@maybe@returnmessage, see below ...

```

4.3 Changing L^AT_EX (Preparations)

Changing L^AT_EX’s \@@input (that stores T_EX’s primitive \input) is not easy (cf. Didier Verna on his fink package,⁸ also `inputfile`); but it should suffice to change two of the three L^AT_EX commands that use \@@input:

```

38 \newcommand\IT@InputIfFileExists[2]{%
39   \IfFileExists{#1}{%
40     {#2@\addtofilelist{#1}\IT@prim@input\@filef@und}}}
... LATEX’s version is \long, as opposed to \input:
41 \newcommand*\IT@input}[1]{%
42   \IfFileExists{#1}{\IT@prim@input\@filef@und}{%
43     {\typeout{No file #1.}}}
... the third macro using \@@input is \input—too difficult for now.
Storing original LATEX:
44 \let\IT@ltx@InputIfFileExists\InputIfFileExists
45 \let\IT@ltx@input\@input

```

4.4 The User Commands

`\dotracinginputs` globally activates input tracing:

```

46 \newcommand*\dotracinginputs}{%
47   \global \let \InputIfFileExists \IT@InputIfFileExists
48   \global \let \@input          \IT@input}

```

`\notracinginputs` globally turns input tracing off:

⁸<http://ctan.org/pkg/fink>

```

49  \newcommand*{\notracinginputs}{%
50    \global \let \InputIfExists \IT@ltx@InputIfExists
51    \global \let \@input \IT@ltx@input}

\setindentunit{⟨cmds⟩} globally sets the “indent unit”—the default
setting is ⟨cmds⟩ = \space\space:

52  \newcommand*{\setindentunit}{\gdef\IT@indent@unit}
53  \setindentunit{\space\space}

\dotracingreturns activates the RETURNING TO message—
54  \newcommand*{\dotracingreturns}{%
55    \global \let \IT@maybe@returnmessage \IT@the@returnmessage}
—\notracingreturns turns it off—
56  \newcommand*{\notracingreturns}{%
57    \global \let \IT@maybe@returnmessage \relax}
—not activated is the default:
58  \notracingreturns

\dotracinginputs returns activates both INPUTTING and RETURNING mes-
sages:
59  \newcommand*{\dotracinginputs}{%
60    \dotracinginputs \dotracingreturns}

\notracinginputs turns off both INPUTTING and RETURNING messages:
61  \newcommand*{\notracinginputs}{%
62    \notracinginputs \notracingreturns}

```

4.5 Package Options

Package Option [i] issues `\dotracinginputs` immediately after loading the package:

```
63  \DeclareOption{i}{\dotracinginputs}
```

Package Option [r] issues `\dotracingreturns` immediately after loading the package:

```
64  \DeclareOption{r}{\dotracingreturns}
```

Package Option [ir] combines the functionality of options [i] and [r]:

```
65  \DeclareOption{ir}{\dotracinginputs\dotracingreturns}
66  \ProcessOptions
67  \endinput
```

5 Coda

You can't overestimate my pride! *That's one small step for a man—one giant leap for TeXkind.*

On the other hand, I probably exhausted the set of possible trials and errors (becoming euphoric when it suddenly worked).

Dedicated to Koppa Aleph Rio Lord.

Worms-Pfeddersheim 2010/10/08, U. L.

```
68 HISTORY
69
70 v0.1 2010/10/08 very first, installed on CTAN same day
71 v0.1a 2010/10/08 doc corrected: LaTeX commands using \@@input;
72                                manual page breaks -- installed on CTAN 2010/10/09
73 v0.2 2010/10/09 \IT@maybe@returnmessage etc.
74 v0.2a 2010/11/11 updated LPPL version
75 v0.3 2012/10/03 \dotracingreturns corrected, [i], [r];
76                                updated (C)
77 2012/10/10 correcting doc. on options, three of them,
78 \notracinginputsreturns
79
```
